1. Rewriting

$S \rightarrow aSb \mid bAA$

$A \rightarrow b \mid AaB \mid a \mid Bc$

$B \rightarrow a \mid Bc$

Formal definition

//nonterminals

$V = \{ \langle S \rangle, \langle A \rangle, \langle B \rangle \}$

//terminals

$E = \{ a, b, c \}$

//Rules

$R = [\langle S \rangle \rightarrow a \langle S \rangle b \mid b \langle A \rangle \langle A \rangle$

$\langle A \rangle \rightarrow b \mid \langle A \rangle a \langle B \rangle \mid a \mid \langle B \rangle c$

$\langle B \rangle \rightarrow a \mid \langle B \rangle c$

$]]$

$S = \langle S \rangle$ //Starting symbol

2. 10 smallest possible string

1) $S \rightarrow bAA \rightarrow baA \rightarrow baa$

2) $S \rightarrow bAA \rightarrow bbA \rightarrow bbb$

3) $S \rightarrow bAA \rightarrow bbA \rightarrow bba$

4) $S \rightarrow bAA \rightarrow baA \rightarrow bab$

5) $S \rightarrow bAA \rightarrow bbA \rightarrow bbBc \rightarrow bbcc$

6) $S \rightarrow bAA \rightarrow baA \rightarrow baBc \rightarrow bacc$

7) $S \rightarrow bAA \rightarrow bBcA \rightarrow bccA \rightarrow bccb$

8) $S \rightarrow bAA \rightarrow bBcA \rightarrow bccA \rightarrow bcca$

9) $S \rightarrow bAA \rightarrow bbA \rightarrow bbBc \rightarrow bbaBc \rightarrow bbacc$

10) $S \rightarrow bAA \rightarrow baA \rightarrow baBc \rightarrow baaBc \rightarrow baacc$

3.

a) $aCbcBbcBb$

$S \rightarrow AB \rightarrow aBBB \rightarrow aCbBB \rightarrow aCbcBbB \rightarrow aCbcBbcBb$

b) $ccbcbbb$

S->cB->ccBb->ccCbb->ccbCAbb->ccbcAbb->ccbcbbb

c) cabbCA

S->BC->cBbC->cabC->cabbCA

4. Generate the 10 smallest possible strings

1) Forstmt->for Condition Block -> for Expression Block

]

//Starting symbol

S= <ForStmt>

6. Find the weakest precondition

$$a = x/(y/3)$$

$$\{B\} = (x > y)$$

$$S1 = y = 2x + 1$$

$$S2 = y = 3x - 1$$

$$\{Q\} = a > 0$$

$$\begin{aligned} \text{wp}(IF, a > 0) &= (x > y \wedge \text{wp}(y = 2x + 1, a > 0)) \vee (x \leq y \wedge \text{wp}(y = 3x - 1, a > 0)) \\ &= (x > y \wedge 2x + 1 > a) \vee (x \leq y \wedge 3x - 1 > a) \\ &= (2x + 1 > a) \vee (3x - 1 > a) \end{aligned}$$

Therefore, a is the weakest precondition.

7. Find the weakest precondition

$$a = x/(y/3)$$

$$\{B\} = (x > y)$$

$$S1 = y=2x+1$$

$$S2 = y = 3x-1$$

$$\{Q\} = a>0$$

$$\begin{aligned} wp(IF, a>0) &= (x > y \wedge wp(y=2x+1, a>0)) \vee (x \leq y \wedge wp(y = 3x-1, a>0)) \\ &= (x > y \wedge 2x+1 > a) \vee (x \leq y \wedge 3x-1 > a) \\ &= (2x+1 > a) \vee (3x-1 > a) \end{aligned}$$

Therefore, a is the weakest precondition.

8. Prove total correctness

$$P \rightarrow \{ \text{some_num} > 0, i = \text{some_num} \}$$

$$B \rightarrow \{ i \neq 0 \}$$

$$\neg B \rightarrow \{ i == 0 \}$$

$$Q \rightarrow \{ \text{apps} = 1 + 2 + \dots + \text{some_num} \}$$

From P and $\neg B \rightarrow \{ \text{some_num} = 0 \}$

Then $Q \rightarrow \{ \text{apps} = 0 \}$

Thus

$\{ \text{some_num} = i, \text{apps} = 0 \}$

while($i \neq 0$) {

$\text{apps} = \text{apps} + i;$

```

    --i;
}

```

From P and B $\rightarrow \{ \text{some_num} > 0 \} \ \&\& \ \{ i \neq 0 \}$

```

    {some_num > 0} && { i != 0}
    apps = apps + i;
    --i;
    {some_num > 0}

```

Finally checking

```

{ some_num > 0, i = some_num, apps = 0 }  $\rightarrow$  {some_num >= 0}
while( i != 0 ){
    apps = apps + i;
    --i;
}
{apps = 1 + 2 + ... + some_num}

```

9. Prove correctness

$P \rightarrow \{ x \neq 0, i = x/x \}$

$B \rightarrow \{ x < 0, i > 0 \}$

$\neg B \rightarrow \{ x \geq 0, i \leq 0 \}$

$Q \rightarrow \{value = x!\}$

Check P and Q

$\{x \neq 0\}$ then $\{i = x/x\}$ is not zero. Thus $Q \rightarrow \{value = x!\}$ is valid.

Check P and B Statement Q

if loop case: assume x is negative the value will get positive number. Then i will get positive number and value will get positive number too because of $\{i = x/x\}$. $x = \text{negative}$, $i = \text{positive}$. Finally pass the while loop. Thus, Q is valid.

Check P and $\neg B \rightarrow Q$

If loop case: assume x is zero then i will be zero. From the $\neg B \{i \leq 0\}$ thus, the statement $\{value \neq i--\}$ will be zero. Then the $Q \rightarrow \{value = x!\}$ is zero. As a result, the rule is satisfied.

Check loop terminate

Whatever the value of x, either positive or negative number, we can pass the if loop with $\{x\}$ positive and $\{i\}$

positive. {i} is positive then while loop executes before it becomes zero. Finally we can terminate while loop.

10. Draw and decorate parse tree

word = 2.0 * (5 - 10)

identifier = float * (integer - integer)

#1 Assign =: identifier = Expr

#2 Expr =: Expr + Term | Expr - Term | Term

#3 Expr1 =: Expr2 - Term [Expr1.type <==
if (Expr2.type == Term.type == integer) then
integer else float]

#4 Term1 =: Term2 * Factor [Term1.type <==
if (Term2.type == Factor.type == integer) then
integer else float]

#5 Term =: Factor [Term.value = Factor.value]

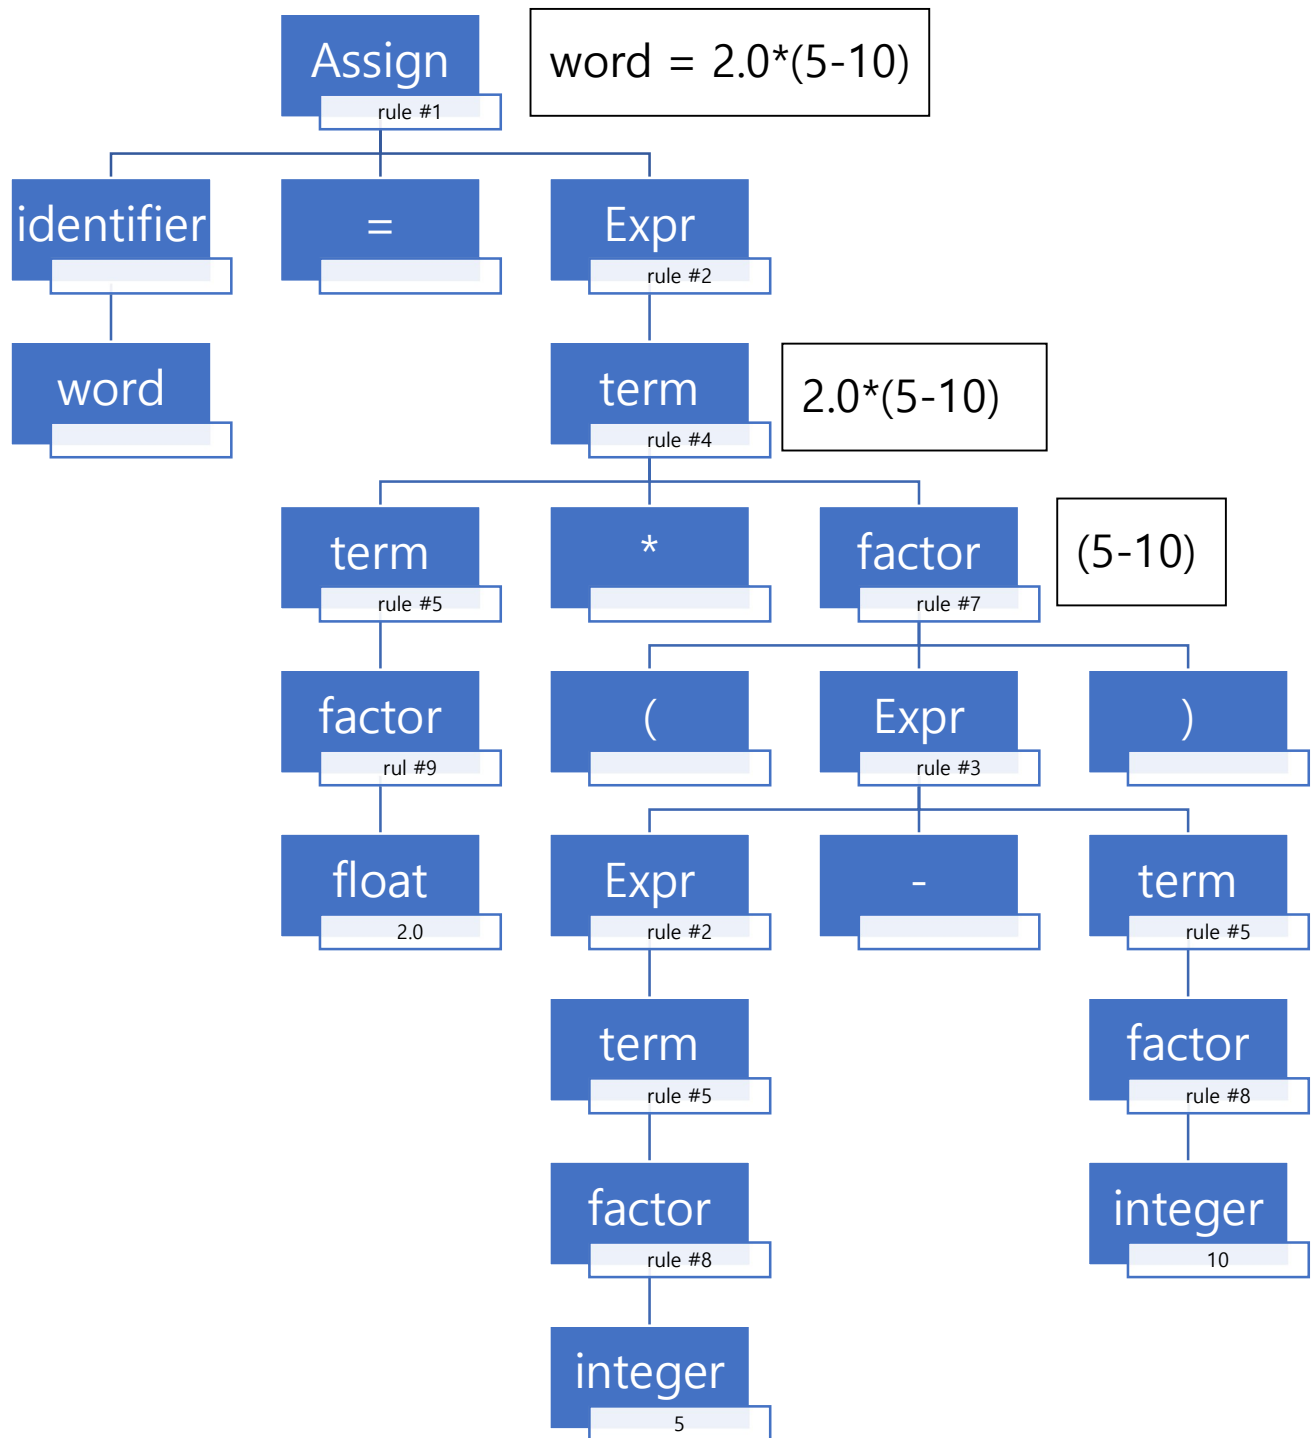

#6 Term =: Factor [Term.type = Factor.type]

#7 Factor =: "(" Expr ")" [Factor.value = Expr.value]

#8 Factor =: integer [Factor.value =
strToInt(integer.str)]

#9 Factor =: float [Factor.value =

strToFloat(float.str)]

11. Rewrit EBNF

- (1) $\langle \text{Floating-point} \rangle = \langle \text{digit-sequence} \rangle \langle \text{exponent} \rangle \{ \langle \text{suffix} \rangle \}$

12. Esoteric programming language, write lexical analyzer. Making OREO

Code:

```
#include <stdio.h>
```

```
#include <string.h>
```

```
#define MAX 10000
```

```
int main(){
```

```
char c[MAX];
```

```
FILE *fp;
```

```
fp = fopen("Q12.txt", "r");
```

```
int i;
```

```
int size;
```

```
if ( fp == NULL) {
```

```
    printf("Cannot open file");
```

```
    return -1;
```

```
}
```

```
fscanf(fp, "%[^\n]", c);
```

```
size = strlen(c);
```

```
    printf("O");
```

```
for(i=0; i<size; i++){
```

```
    if((c[i]>='0'&& c[i]<='9')||(c[i]>='a'&&  
c[i]<='z')||(c[i]>='A'&& c[i]<='Z')){
```

```
        printf("RE",c[i]);  
    }  
    else if(c[i] == ' '){  
        printf("RE");  
    }  
  
    else{  
        printf("&O",c[i]);  
        printf("\n");  
        printf("O");  
    }  
}  
  
    printf("&O");  
    fclose(fp);  
    return 0;  
  
}
```
